### Publication Classification

(52) U.S. Cl. .... 705/1

(57) **ABSTRACT**

A system and method of modeling an enterprise and its objectives and its information technology system into a single enterprise framework so that the effect of changes in one can be seen as impacting the other. In its preferred embodiment, a generic framework is customized to reflect changes for the industry and the enterprise and its objectives and uses a Lotus Notes database with a front-end navigator to make modifications. The enterprise framework includes a section on governance which provides an architectural framework and a management process for the enterprise framework.

## METHOD AND SYSTEM USING AN ENTERPRISE FRAMEWORK

### CROSS REFERENCE TO RELATED PATENTS

[0001] The present invention is related to the following documents, all of which are assigned to the assignee of the present invention and which are specifically incorporated herein by reference:

[0002] Patent application Ser. No. 09/625,108 filed Jul. 25, 2000 by Steven D. Barnes et al. and entitled "Method and System for System Integration", a document which is sometimes referred to in this document as the SI Patent.

[0003] Patent application Ser. No. 09/506,260 filed Feb. 17, 2000 by Brenda Barth-Harvey et al. and entitled "Automated Management Process for Enterprise Resource Planning System Implementation", a document which is sometimes referred to in this document as the Management Process Patent.

[0004] Ser. No. 09/660,852, filed Sep. 13, 2000 by G. Vahee et al. and entitled "Project Management Method and System", a patent which is sometimes referred to in this document as the Worldwide Project Management Patent (or WWPMM) Patent.

### BACKGROUND OF THE INVENTION

#### [0005] 1. Field of the Invention

[0006] The present invention relates to techniques for using an enterprise-wide framework for managing the effects of changes in the business model and/or information technology environment on the operation of an enterprise. More particularly, the present invention includes an improved method and system for managing an enterprise and its information technology, to facilitate the analysis of changes on the enterprise and its information technology environment. The present invention includes an enterprise architecture with business and information technology components and defined linkages between them, which allow for the impact of changes in one component to drive the other component.

#### [0007] 2. Background Art

[0008] The following description of the present invention is based on a presupposition that the reader has a basic knowledge of information technology (sometimes referred to as data processing) environments and the processes of designing, developing, assessing and modifying solutions within an information technology ("IT") function. Some of these processes are described in the SI Patent and the WWPMM Patent and the Management Process Patent referenced above. These patents provide a framework for making recommendations to a business, with regard to the information technology systems required to operate the business, and the management of changes in the business, to accommodate changes in strategy and objectives and, for designing an IT solution for the business.

[0009] Such an IT solution design process inherently involves consideration of the business requirements and objectives—that is, where the business is going and what is required of it. The purpose of any IT solution is to facilitate the underlying business objectives, objectives which may be

subject to change over time. The impact of a change in a business objective may require a change in the IT systems and any change in an IT system may effect the business objectives.

[0010] Many prior art system for modeling a business and its data processing involve two separate and unconnected systems. That is, there is a business system model or architecture and an information technology model or architecture and different organizations are responsible for each and each are independent of the other.

[0011] Thus, the prior art provides systems for proposing change in information technology solutions and changes in business operations which may have undesirable disadvantages and limitations that impact the effectiveness of the assessments and limit the scope and effectiveness of recommendations for improvements. Often, these changes are defined in isolation, or with focus on a single system only, which limits the understanding of the total impact of the business decisions which have been taken.

### SUMMARY OF THE INVENTION

[0012] The present invention overcomes the disadvantages and limitations of the prior art systems by providing a simple, yet effective, way of coordinating an organization's business objectives with its overall information technology (IT) environment.

[0013] The present invention has the advantage that it uses a single enterprise-wide framework which includes and links components from business strategic objectives, desired capabilities, principles business processes, information, IT capabilities with the plans to deliver and implement these capabilities. In the preferred embodiment of the present invention, this enterprise-wide framework is prepared and delivered in the form of a database using a tool such as Lotus Notes and includes a simple navigator which allows for the easy use and modification of any of the components of the framework to reflect changes to the business, its capabilities and offerings.

[0014] The present invention also has the advantage that the business strategic objectives, capabilities, principles, business processes, information and the IT capabilities are linked so that the true impact of a change in one component, can be readily understood and managed. As the business changes its strategy, the effect on its IT environment and operations can be seen and assessed. Likewise, a change in the IT capabilities and systems will have an effect on the business and its operation. These changes, when seen in the context of an enterprise-wide framework, allow the impact of proposed changes to be assessed prior to implementation.

[0015] A further advantage of the present system is that the use of a generic enterprise architecture allows relatively quick and easy customization for a particular organization and its business processes and business operations. That is, a generic enterprise architecture is the beginning point for changes to reflect the differences in the organization, its objectives and its operations.

[0016] The present invention has applicability to various forms of business operations and has been particularly relevant for (but not limited to) businesses who are choosing to embrace the use of electronic commerce as part of their strategic objectives. Use of a single enterprise-wide frame-

work also allows for the integration of outputs from multiple engagements or activities. That is, it allows for the incorporation of outputs from previous and follow-on activities to be easily added, providing an ever-widening picture of the total business and IT environments that can be more effectively managed. The present invention includes an enterprise architecture that uses a common technology model, with business and application models which vary from industry to industry. This allows for generic/common processes, application function, data and infrastructure to be identified and shared, as well as incorporating and building on industry specific components and models.

[0017] Other objects and advantages of the present invention will become apparent to those skilled in the relevant art, as they view the following description of the preferred embodiment, together with the accompanying drawings and the appended claims.

#### BRIEF DESCRIPTION OF THE DRAWINGS

[0018] Having thus set forth some of the limitations and disadvantages of the prior art and some objects and advantages of the present invention, other objects and advantages will be apparent to those skilled in the relevant art, as they view the following drawings and their descriptive material and consider the accompanying claims. These drawings illustrate the present invention of an enterprise-wide framework and method in which:

[0019] FIG. 1 is a diagram illustrating functionally, a prior art approach which looks at the enterprise's business models and environment, separate from its information technology systems and environment;

[0020] FIG. 2 is an alternative diagram of the prior art, illustrating a different approach which considers each business and information technology environment/system as a discrete operation;

[0021] FIG. 3 is a high-level diagram illustrating the integration of the business components with the information technology components, used to create an enterprise architecture of the present invention;

[0022] FIG. 4 is a more detailed diagram illustrating the underlying structure of the database and linkages which are involved in the present invention;

[0023] FIG. 5 provides a detailed view of the component parts of the enterprise-wide framework of FIG. 3, showing the relationship between the various drivers of a business, providing an improved perspective of the present invention.

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

[0024] In the following description of the preferred embodiment, the best implementations of practicing the invention presently known to the inventors will be described with some particularity. However, this description is intended as a broad, general teaching of the concepts of the present invention in a specific embodiment but is not intended to be limiting the present invention to that as shown in this embodiment, especially since those skilled in the relevant art will recognize many variations and changes to the specific structure and operation shown and described with respect to these figures.

[0025] FIG. 1 shows one approach in the prior art to modeling the business, where a first business model 10 deals with the strategy and functions of the business, including the requests 12 it receives for offerings and the goods and services 14 it delivers to customer. The business model 10 generates requirements 30 for its data processing or information technology, which requests are transmitted to the IT function of the organization to handle. The IT function has an IT model 20 which includes various elements of hardware and software to perform the functions set forth in the requirements 30 provided by the business and the business model 10. The IT model 20 includes inputs 22 and outputs 24. This approach is rather simple and does not reflect that the IT operations are interdependent on the business model, with changes in the IT model 20 having the capability to influence changes in the business model 10.

[0026] FIG. 2 illustrated another system for managing the information technology of a business in which the business is a plurality of offerings, represented in this illustration by two of the offerings, service #1 represented by block 42 and service #2 represented by block 52. Each of the offerings independently generates its own set of requirements which are passed to an IT model for that offering, so a first IT model 46 serves service #1 and its requirements as illustrated by the arrow 44 and IT model 56 serves service #2 and its requirements 54. Adding a new service means adding a model of the new service and adding an IT model for the requirements of new service. When a service is provided, it may or may not be related to existing services.

[0027] FIG. 3 illustrates the present invention which is an enterprise architecture 70 which includes and combines a business architecture 72 with an IT architecture 74 into a single and integrated architecture. Also shown are various external items 76 such as strategic directions, capabilities, principles and governance which impact the business architecture 72, the IT architecture 74 or both.

[0028] In its preferred embodiment of the present invention, this enterprise architecture 70, with the business architecture 72 and the IT architecture 74, begins as a generic model which is not specific to any industry, set of offerings or customer and is modified to reflect the differences in the industry and the uniqueness of the customer and its environment and requirements.

[0029] The enterprise architecture 70 may be stored in any convenient tool or repository. While in some cases the architecture may exist solely in a printed form, the printed form is difficult to modify. Consequently, the enterprise architecture of the present invention is often stored in a data processing system in the form of a Lotus Notes database which can be easily accessed and modified. To assist in the access and modification, an optional front-end navigator may be provided which allows for selected sections of the database to be accessed and modified.

[0030] This modification of the generic enterprise model allows for industry practices and customer uniquenesses to be reflected in an enterprise model which is customized to the particular customer, yet based on a common set of technologies.

[0031] FIG. 4 illustrates a form of the generic enterprise architecture 70 of the present invention in which an over-view block 110 introduces other sections and provides a way

to navigate through the model and find a desired portion. These other sections include a governance section 120, an organization section 130, a business IT alignment section 140, a current environment section 150, an enterprise section 160 and a plans section 170.

[0032] The governance section 120 provides architecture management framework, architecture management processes and conformance and evaluation criteria and tools. That is, it includes rules and processes which govern the rest of the operations.

[0033] The organization section 130 includes a structure of the business organization, the IT organization, the roles and responsibilities of members of the organization, either specifically or generally (by department or function, for example). It also includes details on the education and training for the organization as well as an inventory of skills and sets for the policies and practices of the organization. In many organizations, the structure is shown not only for the present but also for the future, including reorganizations which have not yet been implemented.

[0034] The business IT alignment section 140 provides a statement of the business strategy and objectives as well as the IT strategy and vision. It also includes the business model and process.

[0035] The current environment section 150 provides a statement of the business, application environment, data environment, IT environment and management of the organization as it presently exists.

[0036] The enterprise section 160 provides a statement of the capabilities of the organization in terms of its business, IT and business requirements.

[0037] The plans section 170 provides various type of plans for the organization: business, IT, project, transition, and organization and change plans. In addition, the enterprise architecture reflects that groups such as user groups impact the organization and its IT model with the group section 180 and the architecture building blocks 210.

[0038] The enterprise architecture also includes a products section 190, a standards section 200, and a principles section 220. The principles section 220 is coupled to the enterprise section 160, the architectural building blocks 210 and the business IT alignment section 140 and indicates where each principle applies and how it is used. The products section 190 is coupled to the architectural building block section 210, as is the standards section 200, and both indicate which applies to and where each is used.

[0039] Guiding information is provided by block 240 to assist the user in navigating through the enterprise architecture. It includes a user guide 242 on how to use the architecture, a feedback system 244 to provide responses, a support section 245 providing a pointer to where to obtain assistance in using the architecture along with a contact list 248, a glossary 246 which includes definitions of terms used in the architecture so that all terms will be consistently used and a news section 247 which includes information detailing recent changes to the system.

[0040] The present system also include a business section 250 (which includes details on the business areas and units, unit plans, business locations, processes and activities and

needs) and a reference architecture section 260 which includes a description of reference architectures and models.

[0041] FIG. 5 illustrates an elaboration on FIG. 3 to illustrate the relationship of entities and their relationship to illustrate drivers of the business. As shown in this figure, a business 300 defines strategic directions 302 which are delivered by capabilities 304 which are drivers for principles 306 and all of this forms a part of the environment 76 of the business. The environment 76 of the business interacts with the business architecture 72 and the IT architecture 74 as will be described. The capabilities 304 underpin the strategic direction 302 of the organization and are controlled by the principles 306.

[0042] The business architecture 72 indicates that the business has a business structure 310 which is reflected in organization units 312 (sometimes referred to as operating units).

[0043] The organization units 312 have roles and responsibilities 314 which relate to processes 316. The processes 316 are enablers for capabilities 304 of the organization and are implemented in features and functions 318 which deliver the capabilities of the organization. Business information 319 supports processes 316. Events 315 trigger or initiate the processes 316 and may be internal events (such as the time to prepare statements or to post interest) or external events (such as a customer sending in a notice to change his address or a customer conducting a transaction at an automatic teller machine). In any of these circumstances, the event 315 causes a process to be implemented which may use application software and/or data from the IT architecture section as described below.

[0044] The IT architecture 74 includes application software 330 which processes data 332 which includes business information 319 from the business architecture section 72. An enterprise technology framework 340 incorporates the application software 330 and the data 332 as well as the current IT environment 342 and reference architecture 346 and defines a delivery environment 348. The delivery environments 348 include the systems on which data 332 is stored and are implemented at locations 320 using products and standards 336. The enterprise technology framework 340 and the application software 330 are based on the principle 306 providing a framework for component and design decisions.

[0045] Various components of the framework are taught by John Zachman and his teaching is specifically incorporated by reference herein. His teachings are directed primarily to the components and are not integrated into a single framework of the type described in connection with the present invention, however, and his system is lacking in a guiding tool and a single database for ease of reference and use.

[0046] Application software 330 supports user groups 334 which exist at locations 320. Governance 350 manages change and evolution in the current IT environment 342 and other components of the system.

[0047] As an example of a situation where a change in a business framework may influence a change in a information technology framework (and vice versa), consider a company which offers catalog shopping through a printed catalog. If it decides to put the catalog on the Internet and become an

e-tailer, that is a decision in a business framework (its processes) which influences its capabilities and its application software, among other things (in its IT architecture). That same business might have made a decision instead to have a presence on the web, changing its IT architecture with the additional applications and functions to support a web presence. From this change in its IT architecture, its capabilities and its business architecture may also change. Thus, it will be seen that changes in a business's business framework or architecture influence its business architecture or framework and vice versa because of the interrelationships of the elements and the cause and effect relationships between the objectives, the capabilities and the directions of the business, making it desirable (if not necessary) to integrate the consideration of the various aspects of the business together rather than separately.

[0048] Of course, many modifications of the present invention will be apparent to those skilled in the relevant art in view of the foregoing description of the preferred embodiment, taken together with the accompanying drawings. For example, the present invention is not limited to the particular lines of demarcation between various models and, in practice, the enterprise architecture may be delivered in a different tool than the database described and the method of using an altering it may differ from the navigator described herein. In some cases, one of more of the functions may be omitted or combined with other functions. For example, governance may be combined with the business structure in defining the roles and responsibilities for changes within the organization and its processes in some systems. Some of the features and elements of the present invention may be useful without the corresponding use of other features and elements. By illustration, the use of a generic or universal template which applies in various industries is useful, but not essential, to the present invention. Also, the use of locations may not be needed in a small organization which exists at a single location or at which the business and IT functions are managed, for example, in a utility which serves a small geography from a single central location. Additionally, many modifications can be made to the system implementation and the method of implementing security in an IT solution. To illustrate a representative modification, many businesses have deviations based on the requirements of the business and its processes. Accordingly, the foregoing description of the preferred embodiment should be considered as merely illustrative of the principles of the present invention and not in limitation thereof.

Having thus described the invention, what is claimed is:

1. A system for modeling the operation of a business and its information processing, the system comprising:

- a first framework portion which includes features of the business operations and objectives of the business;
- a second framework portion which includes features of the information processing system which the business uses to conduct its business; and

interconnections between the first framework portion related to the business operations and objectives related to the business and the second framework portion which includes functions of the information processing system of the business, whereby changes to the one portion can be seen as changes in the other portion.

2. A system for modeling the operation of a business including the elements of claim 1 wherein the system includes a function of governance which allows for the objectives of the business to be reflected in the model.

3. A system for modeling the operation of a business including the elements of claim 1 wherein the first and second architecture portions are included in a single database.

4. A system for modeling the operation of a business including the elements of claim 3 wherein the first and second architecture portions are included in a single database with a navigator provided for using and modifying the architecture portions.

5. A system for modeling the operation of a business including the elements of claim 1 wherein the first and second architecture portions are included in a single database and modifications to the one architecture portion influence the other architecture portion.

6. A system for modeling an enterprise and its business and IT including the elements of claim 1 wherein the strategic direction, capabilities and principles are integrated with the business architecture and the IT architecture.

7. A method of modeling the business of an enterprise, the steps of the method comprising:

- starting with a generic template which applies across industries to a business and its information technology processes;
- customizing the generic template for the specific industry and the uniqueness of the enterprise; and
- using changes in the business objectives to reflect changes in the information technology processes and the business architecture.

8. A method including the steps of claim 7 and further including a front end navigator for providing access to the business architecture and the information technology architecture.

9. A method of coordinating a business architecture for an organization with its information technology architecture to provide a single structure for considering the effects of changes in the organization, the steps of the method comprising:

- Setting forth the direction, the capabilities and the principles of the organization;

- Organizing the business architecture for the organization including its business information and processes and coupling the processes to the capabilities of the organization;

- Organizing the information technology architecture of the organization including its application software and data and coupling the application software to the processes of the business architecture and to the principles of the organization and coupling the data to the business information, whereby changes to the business architecture flow to the information technology architecture of the organization and changes in the business architecture flow to the information technology architecture of the organization.

10. A method of coordinating the operation of an organization including the steps of claim 9 wherein the method further includes the step of providing a front-end navigator to the business architecture and the information technology architecture for ease in accessing information within the architectures.

11. A method of coordinating the operation of an organization including the steps of claim 9 wherein the method further includes the steps of storing the architectures in a database.

12. A method of coordinating the operation of an organization including the steps of claim 11 wherein the database is a Lotus Notes database.

13. A method of coordinating the operation of an organization including the steps of claim 9 wherein the business architecture includes a business structure, organization units, roles and responsibilities and features and functions as well as events which influence the processes.

14. A method of coordinating the operation of an organization including the steps of claim 9 wherein the information technology architecture includes reference architec-

tures and current IT environment which influence an enterprise technology framework and the application software.

15. A method of coordinating the operation of an organization including the steps of claim 9 wherein the architectures are prepared in a generic format and then the method includes the step of customizing the architectures to apply to a particular instance.

16. A method of coordinating the operation of an organization including the steps of claim 15 wherein the step of customizing the architectures to a particular instance includes the step of customizing the architectures to apply to a particular industry.

17. A method of coordinating the operation of an organization including the steps of claim 15 wherein the step of customizing the architectures to a particular instance includes the step of customizing the architectures to apply to a particular organization.

\* \* \* \* \*
